

Joint reflection note

Our communication has been quite good throughout the whole duration of the exam. With the use of platforms like Discord, Teams, Messenger and Scrumwise we have always been up to speed with everything that's been going on within the group. The use of Discord has been key, with the ability to share your screen, helping each other with problems that occur along the way. In hindsight we would like to have met the group in person more often. We also stumbled upon some miscommunications sometimes, but it never led to something we could not solve.

The task delegation within the group has been flexible, with the use of the backlog and task board in Scrumwise we have had the opportunity to choose from available tasks and move them into the "in progress"-tab leading everyone to know who's always doing what task. Even though some of us are more skilled than others in the group in specific areas, others have joined in to learn as well and get the chance to try out for themselves with the help of each other.

With the strict project timeline we have been working under in mind, we are quite satisfied with the outcome of the solution based on our competence. We would have liked to make the solution even more complex, but we were to build an MVP, not a finished application!

Since this was our first time working with Sprint 2.0 and an agile project in the context of scrum and kanban it wasn't perfect. We would like to build further on the experience we have gained during these weeks. This would have been done by planning from our mistakes, which we are sure would lead to a better execution!

Communication:

We got an even better understanding of the importance of communication and collaboration of a project of this size. We experienced that any form of miscommunication could lead to problems, which lead to more hours of unnecessary work.

Importance of planning:

We learnt that planning ahead in such a project directly impacts the workflow and workload. We forgot to plan more around the minor details that could be time consuming to solve, it's important to write these down and plan for these as well.

Agile project:

We have learnt the process of working with an agile project. The use of Scrumwise has been deemed beneficial by all members of the group. This is something we would consider using in other hobby projects or the likes later on!
